In [hydronic UFH system](#), heated water is propelled from a boiler through a link of tubing underneath the floor. Heat is conducted to the surface of the floor by the hot water, and from there, radiant energy is emitted to the room. The hydronic UFH system is suitable for most floor surfaces such as carpet, ceramic, engineered and solid wood, laminate, stone and vinyl. Since it uses water for heating, it can be linked to any heat source from a standard boiler to newer sustainable technologies such as solar thermal and heat pumps.
