and

ActiveDirectory authentication systems with a secure external connection and many more.
To get more tip of the iceberg, LogicalDOC in the released [Security Paper](#) tells it users how

confortable they can check any of their documents or files anytime with ClamAV Antivirus software, to learn that LogicalDOC's Brute force attack defensive mechanism will make sure that hackers do not get to their files and are immediately blocked from getting to it, Ban unwanted IPs or users with LogicalDOC integrated firewall, Protect entire repositories with by encrypting your storages, Protect each document with a customized password.

LogicalDOC

Antivirus
ClamAV Antivirus is a free, cross-platform and open-source antivirus software toolkit able to detect many types of malicious software, including viruses. One of its main uses is on mail servers as a server-side email virus scanner, which enable LogicalDOC users to be able to filter any emails and IPs that are not meant to access the users files. Both ClamAV and its updates are made available free of charge.

Brute Force Attacks
LogicalDOC knows that hackers will always try to get to their users files that was the reason their Security Paper gave their users the confidence that such actions will be dealt with by the defense mechanism that they put in place. A brute-force attack is an attempt to discover a password by systematically trying every possible combination of letters, numbers, and symbols until you discover the one correct combination that

Security Paper

works. And most experts in hacking use so many methods which are dictionary attack, key derivation function, cryptanalytic attack and so on that makes this combination very simple to guess. But LogicalDOC defense mechanism is equal to the task as stated in their newly released Security Paper.

LogicalDOC integrated firewall
The Security Paper will also enlighten users on the importance of integrated firewall features that will aid LogicalDOC users to effectively discover suspicious users through a specific IPs, networks and hostnames.

LogicalDOC encryption
Another interesting line on the Security Paper is that it tries to let users know that with encryption activation in repository, documents or files stored in LogicalDOC in different repositories such as Local folders, Remote Folders, Amazon S3 buckets and Microsoft Azure containers are safe even when hackers successfully hack it and transfer some information. Because they will also need the

information or credentials used to encrypt it.

Customized password
The released Security Paper is also trying to let LogicalDOC users know that with customized password, confidential document that you only want to share with limited amount of persons will be well protected whenever you share it. Furthermore the presentation gives you guide on how to set the password with just few click. And also advice LogicalDOC users to not issue the password created for confidentiality of a document to many users and point that no extra credential will be needed in order to access such document.
