

# Geophysics Breakthrough - Ideal for VMS / Massive Sulphides / Nickel / Copper Deposits

*HeliSAM and HeliWinder a potent combination for today's mining companies.*

THUNDER BAY, ONTARIO, CANADA, December 18, 2017 /EINPresswire.com/ -- HeliSAM and HeliWinder will maximize investor confidence in the projects where they are employed.

The combination is a hybrid geophysics technique which is able to cover a months worth of ground geophysics inside a few hours.

How does it work?

The loops are laid by helicopter using the HeliWinder technology. Then, basically - a transmitter is placed on the ground - the helicopter then takes off flying up and down the loops measuring the signal. The technology is able to complete a months worth of ground geophysics in a matter of hours. The technology is quite fascinating.

A saavy CEO / geophysical purchaser would be very pleased with the results - defining the ore body, OR NOT - in just a few hours.

Deeper, faster and with amazing clarity.

For more information, call 807 473 3648 and you will be forwarded to our geophysics specialists.

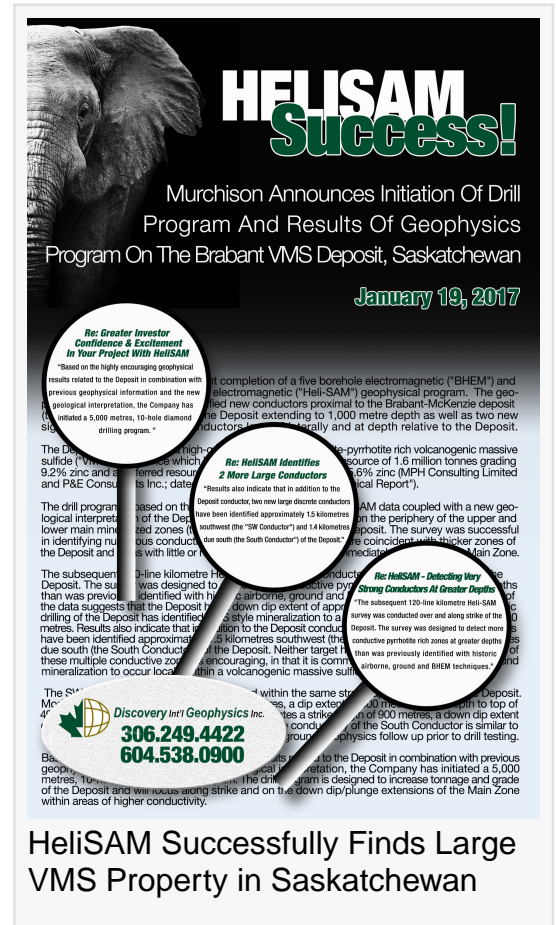

COVER A MONTHS WORTH OF GROUND GEOPHYSICS - IN A MATTER OF HOURS"

**HELISAM Success!**

Murchison Announces Initiation Of Drill Program And Results Of Geophysics Program On The Brabant VMS Deposit, Saskatchewan  
**January 19, 2017**

**Re: Greater Investor Confidence & Excitement In Your Project With HeliSAM**  
"Based on the highly encouraging geophysical results related to the Deposit in combination with previous geophysical information and the new geological interpretation, the Company has initiated a 5,000 metres, 10-hole diamond drilling program."

**Re: HeliSAM Identifies 2 More Large Conductors**  
"Results also indicate that in addition to the Deposit conductor, two new large discrete conductors have been identified approximately 15 kilometres southwest (the "SW Conductor") and 14 kilometres due south (the "South Conductor") of the Deposit."

**Re: HeliSAM - Detecting Very Strong Conductors At Greater Depths**  
"The subsequent 120-kilometre Heli-SAM survey was conducted over and along strike of the Deposit. The survey was designed to detect more conductive pyrrhotite rich zones at greater depths than was previously identified with historic airborne, ground and BHEM techniques."
